**What is Substance Use Disorder:**

Substance Use Disorders are chronic medical conditions that require long term care, monitoring, management strategies and follow up as part of routine medical care across the patient’s lifespan. Much like other chronic diseases such as type II diabetes, cancer and cardiovascular disease.

Like many chronic diseases, several factors can contribute to substance use disorder including genetics, substance use in teen years, environmental factors such as peer influence and poor social skills, and poorly controlled or co-existing mental health conditions.

Substance Use Disorder changes brain structure and function, manifesting in three distinct ways: craving, loss of control over use, and continuing involvement with it despite adverse consequences.

**Treatment:**

Treatment for substance use disorder includes individualized plans for each person that may include hospitalization, outpatient, or residential services; medication; counseling and support groups.

**Prevention and Harm Reduction:**

Harm reduction is a set of practical strategies and ideas aimed at reducing negative consequences associated with substance use disorder.

Can include needle exchange programs, education of injection sites, HIV and hepatitis C screening, screening and referral for substance use disorder and mental health treatment, wound care and naloxone training.

Reducing Stigma through language

What is stigma?
Stigma is a mark of disgrace associated with a particular circumstance, quality or person. Being stigmatized for a substance use disorder can prevent people from seeking and accessing treatment. Below are a few examples of stigma reducing language.
